Art Unit: 2616

DETAILED ACTION

Double Patenting

1. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Omum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Art Unit: 2616

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-18 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-9 of copending Application No. 10/287,959. Although the conflicting claims are not identical, they are not patentably distinct from each other.

For example, Claims 1 and 10 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claim 1 of copending Application No. 10/287,959. The only difference between the two claims is the following:

Claims 1 and 10 of the present application broadens the scope of claim 1 copending Application No. 10/287,959, by omitting the features of

- (I) two independent elementary networks <u>each comprising at least two</u>

 <u>switches, which are interconnected to each other and each connected to at least</u>

 one subscriber equipment;
 - (II) each equipment comprising at least two physical interfaces;
- (III) in transmission of a frame by a source subscriber equipment: addition of a numbering field in each transmitted from, to insert a frame number so that each frame can be identified in time. Send this frame on the concerned elementary network RE1 and RE2; and

(IV) in reception of a frame by a destination subscriber equipment: storage of the received frame number, acceptance of this frame only if its number has not already been received.

However, it would have been obvious to one of ordinary skill in the art to eliminate unnecessary features from the invention of claim 1 of copending Application No. 10/287,959. The motivation would have been to provide a simpler process of implementing a redundant switched full-duplex Ethernet type communication network.

Similarly, claims 2-9 and 11-18 are rejected on the same ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 2-9 of copending Application No. 10/287,959.

This is a <u>provisional</u> obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which

Art Unit: 2616

said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-18 are rejected under 35 U.S.C. 102(e) as being unpatentable over US Patent No. No. 6,282,669 to Imanaka et al. (hereinafter "Imanaka") in view of US Patent No. 6,188,689 to Katsube et al. (hereinafter "Katsube").

Regarding claims 1 and 10, Imanaka teaches a switched full-duplex Ethernet type communication network [Fig. 1] comprising:

at least two independent elementary networks [Fig. 1; System-A & System-B], each elementary network comprising at least one source subscriber equipment [Fig. 1; Node 10] and at least one destination subscriber equipment [Fig. 1; Node 20];

at least one switch to connect the at least two independent elementary network to each other through the at least one physical link [Fig. 1; a connection between Node 10 and System-A Communication Line 1 & System-B Communication Line 2], each equipment being connected to each of these elementary networks [Fig. 1; Nodes 10 & 20 both connect to System-A & System-B]; and

a control configured to perform a frame by frame redundancy on each elementary network [Figs. 1 & 3; Data are, controlled by Control Section 16, concurrently transmitted from Node 10 to both System-A and System-B; col. 3, lines 1-45].

Art Unit: 2616

Imanaka does not expressly teach the source and the destination subscriber equipment connected each other through at least one switch.

Katsube teaches a network, in which the source [Fig. 5(a); Sending Host 311] and the destination subscriber equipment [Fig. 5(a); Receiving Host 313 or 312] are connected each other through at least one switch [Fig. 5(a); e.g. Router 341].

It would have been obvious to a person of ordinary skill in the art at the time of the invention to include a router/switch in a redundant Ethernet communication network system.

The motivation for combining the reference teachings would be to enable a subscriber equipment in a local redundant Ethernet communication network system to communicate a remote subscriber equipment residing in another redundant Ethernet communication network system in order to achieve network and/or transmission data redundancy.

Regarding claims 2 and 11, Imanaka teaches a network, in which there are two elementary networks [Fig. 1; System-A & System-B].

Regarding claims 3 and 12, Imanaka teaches the control performs the frame by frame redundancy by being further configured to, in transmission:

add a numbering field in each transmitted frame [Fig. 2; Data Identifier 7; col. 3, lines 15-29], to insert a frame number [Fig. 4; a unique, consecutive sequence number; col. 3, lines 15-29]; and

Art Unit: 2616

send the frame with the inserted frame member on each of the elementary networks [Figs. 1 & 3; Data are concurrently transmitted from Node 10 to both System-A and System-B; col. 3, lines 30-45].

Regarding claims 4 and 13, Imanaka teaches the control performs the frame by frame redundancy by being further configured to, in reception:

store the received frame number and accept of the frame only if its frame number has not already been received [Fig. 4; steps 113, 114 & 116; col. 4, lines 1-58].

Regarding claims 5 and 14, Imanaka teaches the control is further configured to accept a frame only if it takes place within a given time window [Figs. 5 & 6; steps 132-134 & steps 136-138; col. 6, lines 30-64].

Regarding claims 6, 7, 15 and 16, Imanaka teaches each limitation set forth in its parent claim.

Imanaka does not expressly teaches a virtual link (VL) concept is used, which is a conceptual view of a link from a source equipment to at least one destination equipment and a virtual link number is accepted in the numbering field.

Katsube teaches a virtual link (VL) concept is used, which is a conceptual view of a link from a source equipment to at least one destination equipment [col. 7, lines 18-26] and a virtual link number is accepted in the numbering field

Art Unit: 2616

[Figs. 4(a), 4(b) & 9; Dedicated Virtual Link Indicator DVLI is accepted Datalink header].

It would have been obvious to a person of ordinary skill in the art at the time of the invention to apply the virtual link concept as taught by Katsube and implement to Imanaka's redundant Ethernet communication network system.

The motivation for combining the reference teachings would be to enable a subscriber equipment in a local redundant Ethernet communication network system to communicate a remote subscriber equipment residing in another redundant Ethernet communication network system using the virtual link concept so that each virtual link will not be disturbed by other links which share the same physical link along its route in the network.

Regarding claims 8 and 17, Imanaka teaches each limitation set forth in its parent claim.

Imanaka does not expressly teaches a virtual link (VL) is characterized by: a transfer direction, the virtual link being single directional, a source equipment, one or several items of destination equipment, a fixed passband, a maximum guaranteed time for transfer of packets from a source equipment to a destination equipment, a fixed path on the network and a unique identifier.

Katsube teaches a virtual link (VL) is characterized by:

a transfer direction, the virtual link being single directional [Figs. 5(a), 11-

13; e.g. Input DVLI=x1, Output DVLI=y1; col. 10, lines 53-67];

a source equipment [Figs. 5(a); Sending Host 311];

Art Unit: 2616

or priority];

a fixed passband, a guaranteed maximum time for transfer of packets from a source equipment to a destination equipment [Figs. 10 & 14b; Specify a bandwidth or QoS for each IP flow corresponding to each DVL by allocating an ATM-VC and reserving the bandwidth for the ATM-VC; col. 14,

lines 3-8], regardless of the behavior of the rest of the network, each virtual link

having its own transfer time [Figs. 11 & 15; each virtual link has its own QoS

one or several destination equipment [Figs. 5(a); Receiving Host 312];

a fixed path on the network [Figs. 5(a), 11-13; e.g. a fixed path from Sending Host 311 to Receiving Host 312 via DVLI=x1, DVLI=y1, DVLI=z1 & DVLI=w1]; and

a unique identifier [Figs. 5(a), 11-13; e.g. Input DVLI=x1, Output DVLI=y1; col. 10, lines 53-67].

It would have been obvious to a person of ordinary skill in the art at the time of the invention to apply the virtual link concept as taught by Katsube and implement to Imanaka's redundant Ethernet communication network system.

The motivation for combining the reference teachings would be to enable a subscriber equipment in a local redundant Ethernet communication network system to communicate a remote subscriber equipment residing in another redundant Ethernet communication network system using the virtual link concept so that each virtual link will not be disturbed by other links which share the same physical link along its route in the network.

Art Unit: 2616

Regarding claims 9 and 18, Imanaka teaches a network that is used for implementation of a redundant switched full-duplex Ethernet type communication network in avionics [It is obvious that a redundant switched full-duplex Ethernet-type communication can be deployed in avionics since the technology is obviously not environment dependent].

Conclusion

- 3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
 - US Patent Application Pub. No. US 2006/0107108 A1 by Geng et al. disclose "Service Clusters And Method In A Processing System With Failover Capacity"
 - US Patent No. 5,379,278 to Safadi discloses "Method Of Automatic Communications Recovery"
 - US Patent No. 4,780,869 to Engdahl et al. disclose "Local Area
 Network Redundancy System"
 - US Patent No. 6,766,482 to Yip et al. disclose "Ethernet Automatic Protection Switching"

Art Unit: 2616

4. Any inquiry concerning this communication or earlier communications from

the examiner should be directed to Albert T. Chou whose telephone number is

571-272-6045. The examiner can normally be reached on 8:30 - 17:00.

If attempts to reach the examiner by telephone are unsuccessful, the

examiner's supervisor, Chi H. Pham, can be reached on 571-272-3179. The fax

phone number for the organization where this application or proceeding is

assigned is 571-273-8300.

Information regarding the status of an application may be obtained from

the Patent Application Information Retrieval (PAIR) system. Status information

for published applications may be obtained from either Private PAIR or Public

PAIR. Status information for unpublished applications is available through

Private PAIR only. For more information about the PAIR system, see http://pair-

direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-

freė).
